A First Course in Turbulence Henk Tennekes, John L. Lumley

The subject of turbulence, the most forbidding in fluid dynamics, has usually proved treacherous to the beginner, caught in the whirls and eddies of its nonlinearities and statistical imponderables. This is the first book specifically designed to offer the student a smooth transitional course between elementary fluid dynamics (which gives only last-minute attention to turbulence) and the professional literature on turbulent flow, where an advanced viewpoint is assumed. Moreover, the text has been developed for students, engineers, and scientists with different technical backgrounds and interests. Almost all flows, natural and man-made, are turbulent. Thus the subject is the concern of geophysical and environmental scientists (in dealing with atmospheric jet streams, ocean currents, and the flow of rivers, for example), of astrophysicists (in studying the photospheres of the sun and stars or mapping gaseous nebulae), and of engineers (in calculating pipe flows, jets, or wakes). Many such examples are discussed in the book. The approach taken avoids the difficulties of advanced mathematical development on the one side and the morass of experimental detail and empirical data on the other. As a result of following its midstream course, the text gives the student a physical understanding of the subject and deepens his intuitive insight into those problems that cannot now be rigorously solved. In particular, dimensional analysis is used extensively in dealing with those problems whose exact solution is mathematically elusive. Dimensional reasoning, scale arguments, and similarity rules are introduced at the beginning and are applied throughout. A discussion of Reynolds stress and the kinetic theory of gases provides the contrast needed to put mixing-length theory into proper perspective: the authors present a thorough comparison between the mixing-length models and dimensional analysis of shear flows. This is followed by an extensive treatment of vorticity dynamics, including vortex stretching and vorticity budgets. Two chapters are devoted to boundary-free shear flows and well-bounded turbulent shear flows. The examples presented include wakes, jets, shear layers, thermal plumes, atmospheric boundary layers, pipe and channel flow, and boundary layers in pressure gradients. The spatial structure of turbulent flow has been the subject of analysis in the book up to this point, at which a compact but thorough introduction to statistical methods is given. This prepares the reader to understand the stochastic and spectral structure of turbulence. The remainder of the book consists of applications of the statistical approach to the study of turbulent transport (including diffusion and mixing) and turbulent spectra.

From reader reviews:

Stephen Stover:

What do you concerning book? It is not important along with you? Or just adding material when you really need something to explain what you problem? How about your free time? Or are you busy man? If you don't have spare time to complete others business, it is gives you the sense of being bored faster. And you have extra time? What did you do? Every person has many questions above. The doctor has to answer that question due to the fact just their can do that will. It said that about reserve. Book is familiar on every person. Yes, it is correct. Because start from on pre-school until university need this A First Course in Turbulence to read.

Cora Morrell:

The publication untitled A First Course in Turbulence is the reserve that recommended to you you just read. You can see the quality of the publication content that will be shown to you. The language that creator use to explained their ideas are easily to understand. The copy writer was did a lot of exploration when write the book, therefore the information that they share to your account is absolutely accurate. You also will get the e-book of A First Course in Turbulence from the publisher to make you more enjoy free time.

Eric Freeman:

Spent a free a chance to be fun activity to accomplish! A lot of people spent their down time with their family, or their particular friends. Usually they carrying out activity like watching television, about to beach, or picnic within the park. They actually doing same every week. Do you feel it? Will you something different to fill your own personal free time/ holiday? Could possibly be reading a book is usually option to fill your cost-free time/ holiday. The first thing you ask may be what kinds of publication that you should read. If you want to attempt look for book, may be the book untitled A First Course in Turbulence can be excellent book to read. May be it could be best activity to you.

Steven Burley:

In this period globalization it is important to someone to obtain information. The information will make someone to understand the condition of the world. The condition of the world makes the information quicker to share. You can find a lot of sources to get information example: internet, newspapers, book, and soon. You can view that now, a lot of publisher this print many kinds of book. Often the book that recommended to you personally is A First Course in Turbulence this publication consist a lot of the information in the condition of this world now. This particular book was represented just how can the world has grown up. The vocabulary styles that writer make usage of to explain it is easy to understand. The actual writer made some research when he makes this book. This is why this book appropriate all of you.
